Accela (ACA) is not able to provide several critical functions that the business has asked for. The only option that we currently have is the development of a outside application that integrates with the ACA product. This integration is both at the data and UI layer, with seamless UI transition between the tools ensuring matching theme and definitions. These functions are: **Company Management, Estimator, and Scheduler.** *Stories and process have been defined.*

Company Manager - This is a interface that allows a external company to add and update company information. This information is used as a amenity in ACA associated to the user.

Estimator - Is a sizing, and communication tools that ensures the right people, documents and information have been provided.

Scheduler - Is a resource scheduling and customer communication tools that ensures requirements are met, and the appropriate teams and resources are engaged.
